Working Papers

- "Making Talk Cheap: Generative AI and Labor Market Signaling." *(with Anaïs Galdin.)* 2025.

  Large language models (LLMs) like ChatGPT have significantly lowered the cost of producing written content. This paper studies how LLMs, through lowering writing costs, disrupt markets that traditionally relied on writing as a costly signal of quality (e.g., job applications, college essays). Using data from Freelancer.com, a major digital labor platform, we explore the effects of LLMs' disruption of labor market signaling on equilibrium market outcomes. We develop a novel LLM-based measure to quantify the extent to which an

application is tailored to a given job posting. Taking the measure to the data, we find that employers had a high willingness to pay for workers with more customized applications in the period before LLMs were introduced, but not after. To isolate and quantify the effect of LLMs' disruption of signaling on equilibrium outcomes, we develop and estimate a structural model of labor market signaling, in which workers invest costly effort to produce noisy signals that predict their ability in equilibrium. We use the estimated model to simulate a counterfactual equilibrium in which LLMs render written applications useless in signaling workers' ability. Without costly signaling, employers are less able to identify high-ability workers, causing the market to become significantly less meritocratic: compared to the pre-LLM equilibrium, workers in the top quintile of the ability distribution are hired 19% less often, workers in the bottom quintile are hired 14% more often.

- "Job Matching without Price Discrimination." *(with Wilbur Townsend.) 2026*

  Revise and Resubmit at Games and Economic Behavior

  In many labor markets, firms do not price discriminate among their workers. We study how a labor market with uniform salaries matches workers to jobs. To do so, we construct a job matching model in which each firm views workers as interchangeable and must pay all its workers the same salary. While an efficient stable outcome always exists, inefficient outcomes can be stable as well. Workers' preferred stable outcome is efficient. Firms prefer other (potentially inefficient) stable outcomes in which they pay lower salaries.

Work in Progress

- "Competition to Develop Frontier AI."
  (with Aaron Kaye, Kazimier Smith, and Neil Thompson.)
- "Search and Slop."
  (with Michael Blank and Omeed Maghzian.)
- "The Impact of AI on the Supply and Demand of Labor on Digital Platforms."
